

User Type	Feature	Items	Description	🔒 Level	Comment
All	User & Organization Management	Register an organization	A way to register an organization with organization info such as organization type, organization name and organization address	Basic	Confirmation email is sent to the organization email
		Invite users to join them	Buyers and developers invite users to join their organisations	Advanced	User receives Organization Invitation
		Assign permissions to users	Admin assigns permissions and approves permission requests to users	Advanced	ApiUser Request permissions
		Manage users within an organization	The organization admin can manage all users under their organization	Advanced	
		Verify user emails	Users can verify their email addresses through the link they receive in their email.	Advanced	User receives verification email
		Reset and change passwords	Users can reset their password through the forgot password link on the landing page.	Basic	When a user request to change the password they receive a reset password email
Admin	Yield configuration	Configure Yield Values	Define yield values for specific countries.	Basic	
		Validate Yield Values	Using yield values to validate meter readings and compare with device capacities.	Basic	
DRE Project Developer	Device Management	Device registration	A way to register devices with information such as: Name, type, country, address, location (GPS coordinates), commission date, role, fuel code, and SDG benefit	Basic	
		Bulk device upload	This feature allows uploading a CSV containing the device data and uploads them all at once	Basic	
		Device view and filtering	Viewing devices is possible. When there are many and you need to get specific ones you can filter based on device information such as device country code device type code off-taker,...	Advanced	Developers can view their devices while admins can view all devices
		Device editing	Developers can edit their devices based on which device information they want to edit. All device information is editable.	Basic	
	Meter Reads	Add meter reads	- Meter reads are associated with a specific organization on the platform. - The device's External ID should be added. - The type of reading must be specified as either History, Delta, or Aggregate. - The unit of the meter read must be defined (Wh, kWh, MWh, or GWh). - Meter read values should also be provided. - Depending on the type of meter read, the end datetime must be specified, except for History readings, where the start datetime and end datetime are required.	Basic	
		View and filter meter reads	- The platform offers a way to view and filter meter reads based on: - Organization - External device ID - Start and end dates	Basic	
		History Reads	- Supports the addition of historical data. - Validates that historical data is not older than the device commissioning date. - Ensures meter read power does not exceed the device capacity. - Confirms that start times are always before the device onboarding time. - Historical meter data valid for certification is limited to 3 years. - Ensures historical meter read values are non-negative	Basic	

User Type	Feature	Items	Description	🔒 Level	Comment
		Aggregate Reads	- Aggregate readings represent the current readings of the meter. - Aggregate readings are converted into Delta readings in the backend to generate certificates for buyers. - Developers can input data daily, weekly, or monthly, based on their preferences. - Validates readings against device capacity and the specified time period for electricity generation.	Basic	If the first device reading is aggregate, then it should not be able to change to other types of readings
		Delta Reads	- Delta readings are pre-calculated by the developer and entered into the system for certification. - Validates that the end timestamp is not later than today and does not exceed the device onboarding date. - Validates readings based on device capacity and the specified time period for electricity generation. - Ensures the first device reading of Delta type cannot be changed to other types.	Basic	If the first device reading is delta, then it should not be able to change to other types of readings
Corporate Buyer	Reservation	Reserve devices	Link reservations to specific devices using their External ID; multiple devices can be included.	Advanced	
		Define reservation attributes	Set attributes for reservations, including target power output, start and end dates, expiration date, and frequency (hourly, daily, weekly, monthly).	Advanced	
		Lock reserved devices	Ensure reserved devices remain unavailable for new reservations while reservations are active.	Advanced	
		View and filter reservation	Reservations are viewed with their details and once there are many and you want to view a specific one you can filter it based on some reservation info such as reservation name, off-taker, reservation status,...	Basic	
	D-RECs Token	Issue Tokens	Create tokens based on buyer reservations and monitor meter readings within reservation timeframes.	Basic	
		Continuously Monitor Reserved Devices	Monitor power output and issue tokens per the specified frequency until the target is reached.	Basic	
		View tokens	Tokens are viewed as certificates with all their information like the dates it was generated and the volume it owned.	Basic	
		Filter Tokens	Tokens are filtered as certificates using some of the certificate information.	Not Available
